Dashboard Design Specification

Detailed project document · Prepared for project completion and review

Project reference information

Item	Known project detail
Project	Health360 Clinical & Healthcare Risk Analysis
Dataset size	5,000 patient/person records
Dataset fields	17 columns; exact field names and definitions must be copied from the source dataset's header row/data dictionary
Analytics tool	Tableau
Visual assets	9 worksheets/visualizations and a dashboard; a Tableau story for Patient Risk & Lifestyle Insights was also part of the project workflow
Repository	https://github.com/en25cs3010918-ctrl/Health360-Healthcare-Risk.git
Website	https://en25cs3010918-ctrl.github.io/Health360-Healthcare-Risk/
Scope caution	This is an educational data-visualization project. It is not a clinically validated diagnostic, prognostic, or treatment system.

Design goal

The dashboard should provide an at-a-glance overview of the Health360 dataset and let users explore the available indicators. The final design must reflect actual workbook content; the following specification describes design checks, not a claim that every element is already implemented.

Layout hierarchy

Place a concise title and scope statement first. Group related metrics and charts. Use a consistent grid, aligned edges, adequate spacing, and a clear reading order. Put global filters in a predictable location and explain whether they affect all charts or only selected views. Avoid excessive KPI cards that repeat the same information.

Chart specification

For each of the nine worksheets, document: worksheet title; question; chart type; dimensions; measures; aggregation; filters; sorting; color/size/position encoding; tooltip fields; expected user action; and known limitation. Select chart types based on the analytical task rather than decoration. Use bars for comparisons, lines for ordered time series, distributions for spread, and scatter plots for relationships when appropriate.

Metric and filter rules

A metric card must state its name, unit, aggregation, and population. Percentages must state the denominator. Filters should include sensible defaults, clear labels, and a reset option where possible. Avoid filters that leave the user with no visible explanation when they produce an empty result.

Accessibility and responsive design

Use adequate contrast and avoid relying on red/green alone. Keep chart labels readable. On small screens, prefer vertical stacking or a clear scroll area over shrinking charts until labels become unreadable. Test the actual published dashboard on mobile and desktop.

Dashboard QA checklist

Confirm all worksheets load; titles match the report; units and formats are consistent; filters produce expected results; tooltips are meaningful; sorting is correct; nulls are handled intentionally; dashboard actions are documented; the layout does not hide key information; and the published URL works for a signed-out viewer.

Completion and review record

Prepared by: _____ Date: _____
