Story Design and Narrative

Detailed project document · Prepared for project completion and review

Project reference information

Item	Known project detail
Project	Health360 Clinical & Healthcare Risk Analysis
Dataset size	5,000 patient/person records
Dataset fields	17 columns; exact field names and definitions must be copied from the source dataset's header row/data dictionary
Analytics tool	Tableau
Visual assets	9 worksheets/visualizations and a dashboard; a Tableau story for Patient Risk & Lifestyle Insights was also part of the project workflow
Repository	https://github.com/en25cs3010918-ctrl/Health360-Healthcare-Risk.git
Website	https://en25cs3010918-ctrl.github.io/Health360-Healthcare-Risk/
Scope caution	This is an educational data-visualization project. It is not a clinically validated diagnostic, prognostic, or treatment system.

Narrative purpose

The Health360 story, referred to in the project workflow as Patient Risk & Lifestyle Insights, should guide the viewer through a small number of evidence-supported observations. It should not simply duplicate the dashboard. The narrative should establish scope, present a pattern, explain what can be inferred, and state the limitations.

Recommended sequence

Point 1 — Context: explain dataset coverage, record count, and the meaning of key fields. Point 2 — Overview: present a broad distribution or summary that is actually available in the workbook. Point 3 — Comparison: compare groups using a documented metric and denominator. Point 4 — Relationship: show an association only if supported by the selected variables and sample. Point 5 — Interpretation: explain plausible implications without asserting causation. Point 6 — Limitations: disclose data coverage, missingness, possible confounding, and lack of clinical validation.

Evidence rules

Each story point should include a clear title, a chart that supports the title, a brief annotation, and the filter state or population covered. A title should not claim more than the chart demonstrates. Avoid causal terms such as causes, leads to, or prevents unless the research design supports causality.

Writing pattern

Use this pattern for each insight: Observation — what the chart visibly shows; Context — what group/time/metric is shown; Interpretation — what the pattern may suggest; Caveat — what cannot be concluded from the available data. If the evidence is weak or unclear, state that instead of forcing a dramatic conclusion.

Story review checklist

Check the order of story points, spelling, metric consistency, filter state, axis units, and link availability. Ensure the story and dashboard do not use contradictory definitions. Verify that screenshots or exported images correspond to the current published workbook version.

Completion and review record

Prepared by: _____ Date: _____

Reviewed by: _____ Status: Draft / Reviewed / Approved

Document-control note: Update this file when the dataset, workbook, published views, or website changes. Record version/date and keep claims tied to evidence. This detailed document uses known project context and explicitly flags details that must be verified from the actual source files.
